## 五、Schematics

## 六、Design Guidance

### 1. Application circuit

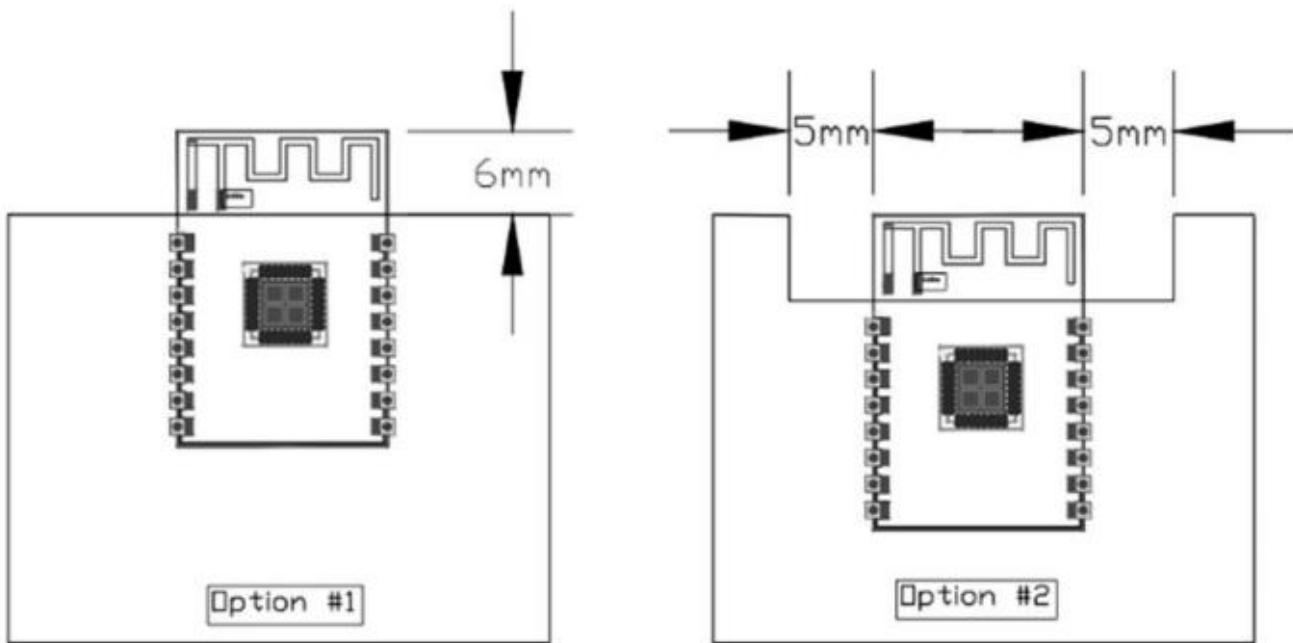

### 2. Antenna layout requirements

For the installation position on the motherboard, the following two methods are recommended:

Solution 1: Place the module on the edge of the motherboard, and the antenna area extends beyond the edge of the motherboard.

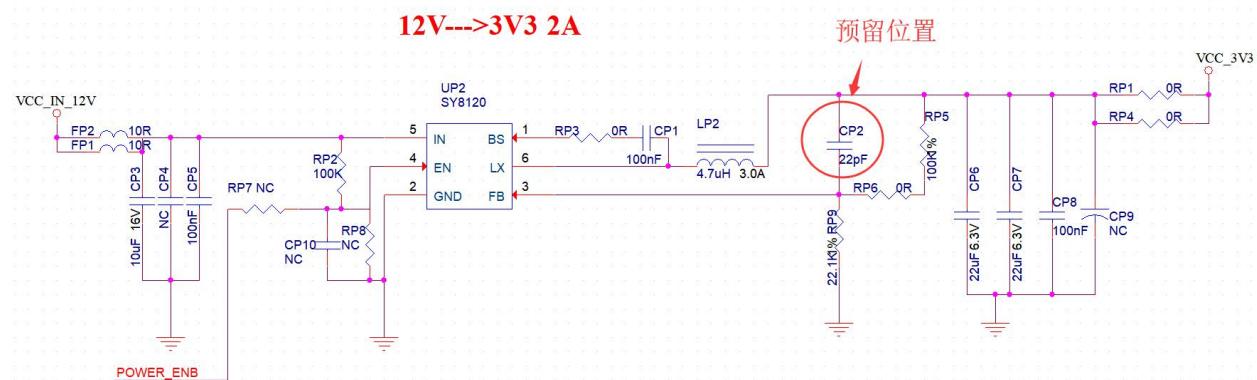

Solution 2: Place the module on the edge of the motherboard, and the edge of the motherboard hollows out an area at the antenna position.

In order to meet the performance of the on-board antenna, it is prohibited to place high-frequency devices or metal parts around the antenna.

### 3、Power

- (1) Recommended 3.3V voltage, peak current above 100mA
- (2) It is recommended to use LDO power supply; if using DC-DC, it is recommended to control the ripple within 30mV.
- (3) The DC-DC power supply circuit is recommended to reserve the position of the dynamic response capacitor, which can optimize the output ripple when the load changes greatly.
- (4) 3.3V power interface is recommended to add ESD devices.

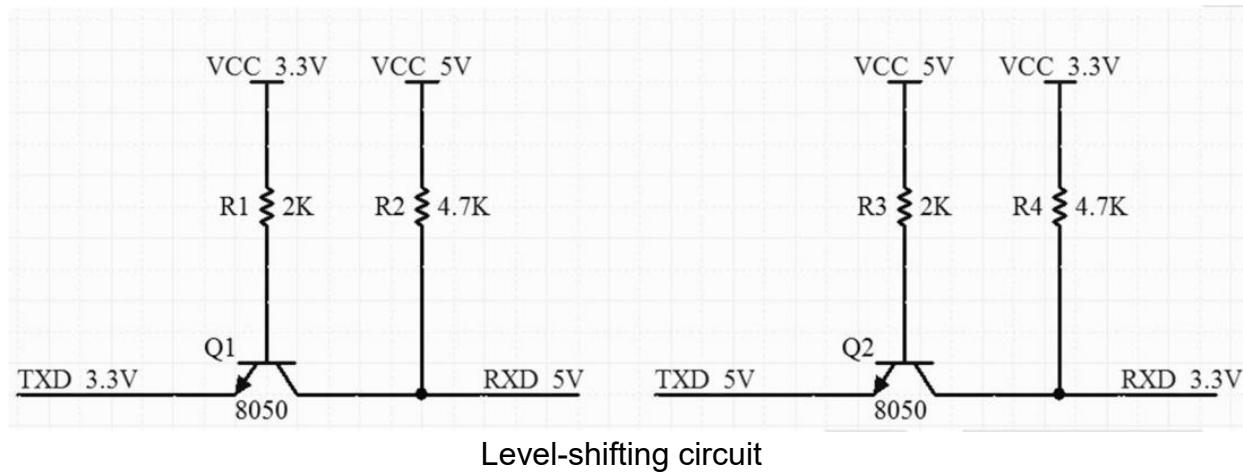

### 4、Use of GPIO port

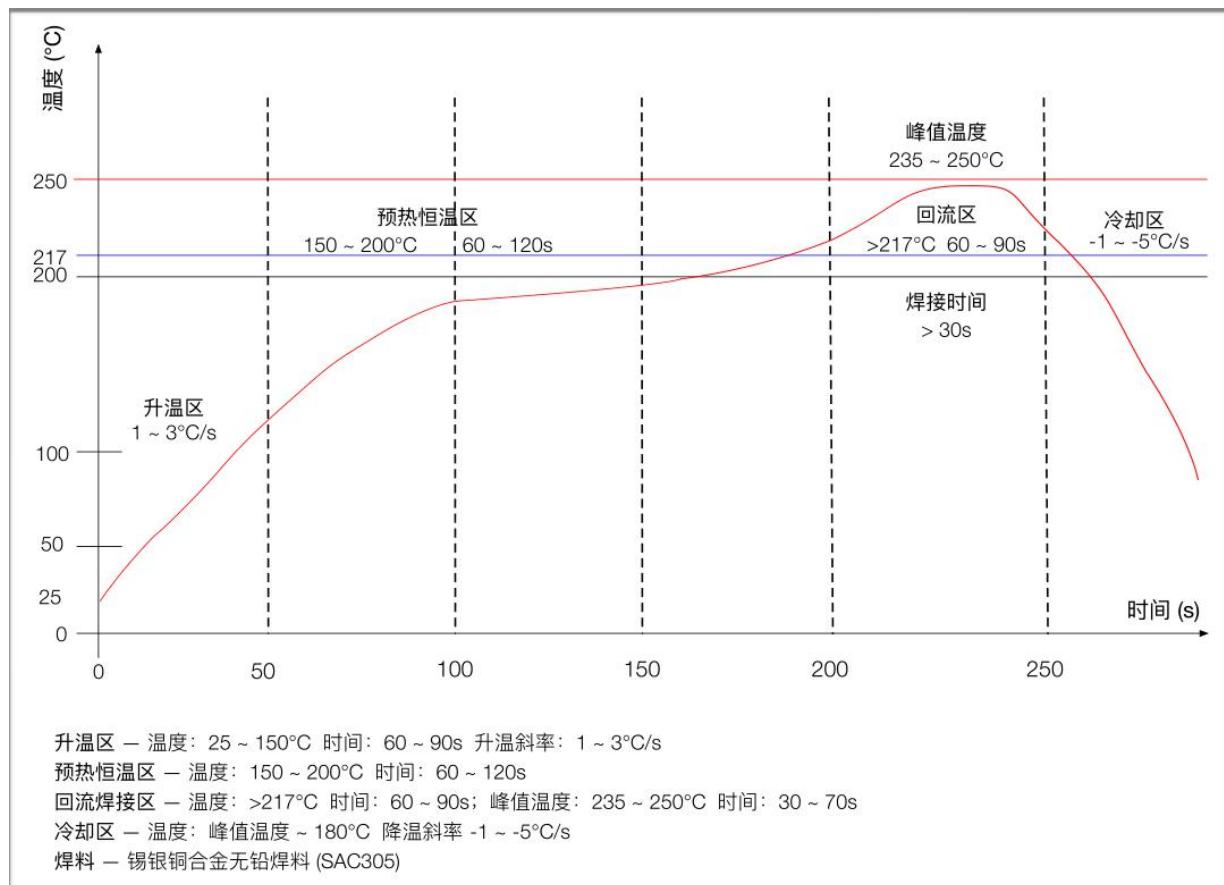

- (1) There are some GPIO ports on the periphery of the module. If you need to use a 10-100 ohm resistor in series with the IO port, it is recommended. This can suppress the overshoot, make the levels on both sides more stable, and help both EMI and ESD.
- (2) The special IO port is pulled up and down, please refer to the instruction manual of the specification, this will affect the startup configuration of the module.
- (3) The IO port of the module is 3.3V. If the IO level of the main control and the module does not match, a

level conversion circuit needs to be added.

(4) If the IO port is directly connected to a peripheral interface, or a pin or other terminal, it is recommended to reserve an ESD device near the terminal of the IO trace.
